Abstract: Let N be a $(n + 1)$ -dimensional globally hyperbolic Lorentzian manifold with a compact Cauchy hypersurface S_0 and F a curvature function, either the mean curvature H , the root of the second symmetric polynomial $\sigma_2 = \sqrt{H_2}$ or a curvature function of class (K^*) . We consider curvature flows with curvature function F and a volume preserving term and prove long time existence of the flow and exponential convergence of the corresponding graphs in the C^∞ -Topology to a hypersurface of constant F -curvature, provided there are barriers. Furthermore we examine stability properties and foliations of constant F -curvature hypersurfaces.
