## 1. ALGEBRAIC INDEPENDENCE AND TRANSCENDENCE DEGREE

# **Definition 1.1.** (Recall) Let E/F be a field extension:

- (1)  $A \subseteq E$  is called **algebraically independent** over F if  $\forall a_1, \ldots, a_n \in A$  there exists no nonzero polynomial  $f \in F[x_1, \ldots, x_n]$  s.t.  $f(a_1, \ldots, a_n) = 0$ .
- (2)  $A \subseteq E$  is called a **transcendence basis** of E/F if A is a maximal subset (w.r.t. inclusion) of E which is algebraically independent over F.

## **Lemma 1.2.** Let E/F be a field extension.

- (1) (Steinitz exchange)  $S \subseteq E$  is algebraically independent over F iff  $\forall s \in S : s$  is transcendental over  $F(S \{s\})$  (the subfield of E generated by  $S \{s\}$ ).
- (2)  $S \subseteq E$  is a transcendence base for E/F iff S is algebraically independent over F and E is algebraic over F(S).

Proof. Exercise 1 of ÜB 6.

**Theorem 1.3.** The extension E/F has a transcendence base and any two transcendence bases of E/F have the same cardinality.

*Proof.* The existence follows by Zorn's lemma and the second statement uses the Steinitz exchange lemma (above).

**Definition 1.4.** The cardinality of a transcendence base of E/F is called the **transcendence degree** of E/F, denoted by trdeg (E) over F.

## 2. KRULL DIMENSION OF A RING

**Definition 2.1** Let *A* be a commutative ring with 1.

- (1) A **chain** of prime ideals of *A* is of the form  $\{0\} \subseteq \wp_0 \subsetneq \wp_1 \subsetneq \ldots \subsetneq \wp_k \subsetneq \ldots \subsetneq A$ , where  $\wp_i$  are prime ideals of *A*.
- (2) The **Krull dimension** of A, denoted by dim (A) is defined to be the maximum k such that there is a chain of prime ideals of length k in A, i.e.  $\wp_0 \subseteq \wp_1 \subseteq \ldots \subseteq \wp_k [\dim(A) \text{ can be infinite if arbitrary long chains}].$

**Theorem 2.2.** Let F be a field and I be any prime ideal in F[X]. Then

$$\dim\left(\frac{F[\underline{X}]}{I}\right) = \operatorname{trdeg}\left(ff\left(\frac{F[\underline{X}]}{I}\right)\right).$$

**Recall 2.3.** For  $S \subseteq F^n$ 

$$I(S) = \{ f \in F[X] \mid f(x) = 0, \forall x \in S \}$$

is the ideal of polynomials vanishing on S.

**Definition 2.4. Dimension of semi-algebraic sets**  $\subseteq \mathbb{R}^n$ : Let  $K \subseteq \mathbb{R}^n$  be a semi-algebraic set. Then

$$\dim(K) := \dim\left(\frac{\mathbb{R}[\underline{X}]}{I(K)}\right).$$

In the lecture 10 (Proposition 1.2) we have proved the following proposition:

**Proposition 2.5.** Suppose  $n \geq 3$ . Let  $S = \{g_1, \ldots, g_s\}$  be a finite subset of  $\mathbb{R}[\underline{X}]$  such that  $K_S \subseteq \mathbb{R}^n$  and  $\mathrm{int}(K_S) \neq \emptyset$ . Then there exists  $f \in \mathbb{R}[\underline{X}]$  such that  $f \geq 0$  on  $\mathbb{R}^n$  and  $f \notin T_S$ .

This is just a special case of the following result due to Scheiderer:

**Theorem 2.6.** (Scheiderer) (Theorem 1.11 of lecture 10) Let S be a finite subset of  $\mathbb{R}[\underline{X}]$  and  $K_S \subseteq \mathbb{R}^n$  s.t.  $\dim K_S \geq 3$ . Then there exists  $f \in \mathbb{R}[\underline{X}]$ ;  $f \geq 0$  on  $\mathbb{R}^n$  and  $f \notin T_S$ .

To deduce Proposition 2.5 using Theorem 2.6 it suffices to prove the following lemma:

**Lemma 2.7.** Let  $K \subseteq \mathbb{R}^n$  be a semi algebraic subset. Then

$$int(K) \neq \phi \Rightarrow dim(K) = n$$

*Proof.* We have dim  $(K) = \dim \left(\frac{\mathbb{R}[\underline{X}]}{I(K)}\right)$ , and

we **claim** that  $I(K) = \{0\}$ :

 $f \in \mathcal{I}(K) \Rightarrow f = 0$  on  $K \Rightarrow f = 0$  on  $\underbrace{int(K)}_{(\neq \phi)} \Rightarrow f$  vanishes on a nonempty open

set  $\Rightarrow f \equiv 0$  (by Remark 2.2 of lecture 2).

So, dim (K) = dim  $(\mathbb{R}[X])$  = trdeg  $(\mathbb{R}(X))$  over  $\mathbb{R}$ 

$$= n$$

## 3. LOW DIMENSIONS

**Proposition 3.1.** Let n = 2,  $K_S \subseteq \mathbb{R}^2$  and  $K_S$  contains a 2-dimensional affine cone. Then  $\exists f \in \mathbb{R}[X, Y]$ ;  $f \geq 0$  on  $\mathbb{R}^2$ ;  $f \notin T_S$ .

**Definition 3.2.** (For n = 1) Let K be a basic closed semi algebraic subset of  $\mathbb{R}$ . Then K is a finite union of intervals.

The natural description S of K as basic closed semi algebraic subset is defined as

- 1. if  $a \in \mathbb{R}$  is the smallest element of K, then take the polynomial  $X a \in S$
- 2. if  $a \in \mathbb{R}$  is the greatest element of K, then take the polynomial  $a X \in S$
- 3. if  $a, b \in K$ , a < b,  $(a, b) \cap K = \phi$ , then take the polynomial  $(X a)(X b) \in S$
- 4. no other polynomial should be in *S*.

**Proposition 3.3.** Let  $K \subseteq \mathbb{R}$  be a basic closed semi algebraic subset and S is the natural description of K. Then  $\forall f \in \mathbb{R}[X]$ :

$$f \ge 0$$
 on  $K \Rightarrow f \in T_S$ ,

i.e. for every basic semi algebraic subset K of  $\mathbb{R}$ , there exists a description S (namely the natural) so that  $T_S$  is saturated.

**Proposition 3.4.** Let  $K \subseteq \mathbb{R}$  be a non-compact basic semi algebraic subset and S' be a description of K. Then

 $T_{S'}$  is saturated  $\Leftrightarrow S' \supseteq S$  (up to a scalar multiple factor).

# **Remark 3.5.** Summarizing:

- (1)  $\dim(K_S) \ge 3 \Rightarrow T_S$  is not saturated.
- (2)  $\dim(K_S) = 2 \Rightarrow T_S$  can be or cannot be saturated (depending on the geometry of K and S).
- (3)  $\dim(K_S) = 1 \Rightarrow T_S$  can be or cannot be saturated [but depends on K and description S of K, if  $n \ge 2$ ).

After all this discussion about positive polynomials, strictly positive polynomials, we now want to show **Schmüdgen's Positivstellensatz**:

**Theorem 3.6.** (Schmüdgen's Positivstellensatz) Let  $S = \{g_1, \ldots, g_s\}$  be a finite subset of  $\mathbb{R}[X_1, \ldots, X_n]$  and  $K_S \subseteq \mathbb{R}^n$  be a compact basic closed semi algebraic set. And let  $f \in \mathbb{R}[X]$  s.t. f > 0 on  $K_S$ . Then  $f \in T_S$ .

**Note** that this holds for every finite description *S* of *K*.

To prove this we first need Representation Theorem (Stone-Krivine, Kadison-Dubois), which will be proved in the next lecture.
